Open to Senior Technical Program Manager, Platform, and Infrastructure roles

SUMMARY

Senior Technical Program Manager / Backend Engineer with a hybrid background in software engineering, program leadership, and client-facing technical delivery. Proven track record of driving large-scale platform migrations, leading cross-functional initiatives, translating business requirements into production systems, and delivering scalable solutions on AWS.

PROFESSIONAL EXPERIENCE

Marigold (acquired by Zeta Global)

Senior Technical Program Manager / Backend Engineer

2021 – 2026

Program Leadership & Delivery

- Led delivery of multiple cross-functional initiatives spanning engineering, SRE, and product teams, ensuring alignment, execution, and on-time delivery
- Led migration from Phabricator to Bitbucket across engineering, SRE, and client development teams (3 repositories), defining migration strategy, redesigning branching models, enabling automated commits via bot/service accounts, and improving code review quality and reducing production issues
- Directed migration from on-prem Jira to Jira Cloud across 20 projects and 15 teams, redefining workflows for cloud constraints and incompatible plugins, establishing ticket migration cutoffs, and managing external contractors within budget
- Established team execution processes and built Jira/Notion/n8n automation workflows for delivery tracking, stakeholder reporting, and stale-ticket visibility, improving execution discipline across cross-functional initiatives

Machine Learning / Data Platform

- Led onboarding of 100+ clients to ML platform over two quarters, translating client data requirements into ingestion pipelines using ClickHouse S3 integration and EventBridge to process multi-terabyte datasets (10–50GB per client)
- Partnered with Analytics to deliver nightly pipelines using Athena and S3, defining ClickHouse queries, implementing client-driven export controls via flag files, enabling cross-team S3 access via AWS SAM, and building monitoring to ensure reliable ingestion
- Contributed to delivery of Propensity-to-Purchase and Discount Optimization models via a serverless ML platform (Lambda, SQS, EventBridge, SageMaker), coding a data assessment layer and partnering across teams to source higher-quality purchase data from distributed systems (ClickHouse, Hive)

Platform & Backend Systems

- Developed a containerized API proxy and token management system on AWS ECS/Fargate, improving authentication reliability and service scalability in a high throughput system

- Drove migration from Oracle to MySQL, including schema redesign, data migration strategy, and implementing code changes to eliminate legacy database dependencies
- Coordinated migration of image caching infrastructure from Akamai to Cloudflare, updating application code and partnering with clients to manage domain certificate changes
- Developed backend services for authentication, campaign data, service health, and DynamoDB integrations in high-throughput systems
- Defined API contracts using Swagger/OpenAPI to support cross-team and client-facing integrations, improving implementation clarity across engineering, SRE, and partner teams

Observability & Reliability

- Led development of a custom observability framework (structured logging, distributed tracing, Prometheus, Grafana) for high-throughput, time-sensitive systems processing thousands of event based messages per minute
- Built AI-powered incident summarization system using AWS Lambda, SAM, DynamoDB, Claude, Slack, and Jira to ingest alerts from CloudWatch, Datadog, and GitHub Actions, deduplicate incidents, and generate operational summaries

Cheetah Digital

Technical Program Manager / Software Developer

2015 – 2021

- Led Agile delivery processes as Scrum Master across multiple engineering teams, improving planning accuracy and execution consistency
- Coordinated cross-functional efforts between engineering, SRE, and release teams to deliver platform enhancements
- Contributed to backend services and data processing systems supporting high-volume client workloads
- Partnered directly with enterprise clients to scope integrations, troubleshoot data and workflow issues, and translate client requirements into backend delivery plans

CheetahMail / Experian

Software Developer / Client Solutions Team

2008 – 2015

- Served as developer and Scrum Master across product development and client solutions teams, partnering with clients, account teams, and engineering to deliver custom technical solutions
- Designed and implemented client-specific remarketing and personalization campaigns using behavioral data from Coremetrics, Google Analytics, and Omniture, including abandoned-cart and browse-recovery workflows
- Built automated ETL pipelines to ingest, parse, validate, and transform client data feeds in text and XML formats into BerkeleyDB/CDB-backed systems
- Integrated client imports, exports, and APIs, translating business requirements into scalable data workflows and third-party platform integrations

TECHNICAL SKILLS & EDUCATION

Languages: Python, Ruby, Perl, Bash

AWS: ECS/Fargate, Lambda, SQS, EventBridge, SageMaker, S3, Athena

Data: MySQL, PostgreSQL, ClickHouse, Hive, DynamoDB

Observability: Prometheus, Grafana, distributed tracing, structured logging

Tools: Git (Bitbucket), Jira, Confluence, Swagger/OpenAPI, Docker, Cursor, Notion, n8n

Education: Bachelor of Arts, International Relations — Tulane University - 1998

Certifications: AWS Solutions Architect - Associate, Certified Scrum Master (CSM)
